

PRAETOR — an accounts-payable agent that cannot be hijacked by the document it is reading

The model handles **references**, **never values**. Every consequential decision is made by deterministic code that no prompt can reach — so a fully compromised reader still cannot change what gets paid. Measured: the agent was talked into the wrong answer twice, and was overruled both times.

Google All Things Agentic · **Taskmaster**

Runs today: Gemma 3 on-device · Gemini 3.5 Flash-Lite → Flash · SQLite · OpenTelemetry

Deployed: Cloud Run **asia-south1** · Cloud Firestore Next: Pub/Sub · Cloud Trace

kernel that stops them runs at **4,112 documents/second** on one core
— 7,300x faster than the model it protects.

Design decisions, with what each one costs: [docs/DECISIONS.md](#)

Prior art, stated up front: CaMeL (arXiv 2503.18813) · RTBAS (arXiv 2502.08966) · Fides · APPA · TraceAegis. AP automation is occupied by Ramp, Vic.ai, AppZen; vendor verification by Trustpair, nsKnox, apexanalytix. This is an engineering demonstration, not a market claim.
